

Forklift Grapple

Grapple for Forklift - Grapples work together with the crowning operation of the bucket cylinder situated on the excavator. They can mount directly onto the jib or whichever quick hitch that is in bucket position. Grapples are most often used for the handling and processing of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This manufactured design provides the grapple with utmost strength and support by means of stopping the body from breaking and turning throughout its operation.

Each moving part which encompass the grapple, including the toes, are made out of hardened steel. The pivot points have been specifically designed to be able to ensure supreme closing force and holding ability. The operator has the capacity to handle different sizes and varieties of materials using the jaws built-in at the end part of the grapple with toes. This could enable the jaws to be able to close through one another in a finger configuration for maximum handling capacity.
